Foreword

This is version 4.0 of the Linux Standard Base Core Specification for IA64. This specification is part of a family of specifications under the general title "Linux Standard Base". Developers of applications or implementations interested in using the LSB trademark should see the Linux Foundation Certification Policy for details.

Introduction

The LSB defines a binary interface for application programs that are compiled and packaged for LSB-conforming implementations on many different hardware architectures. Since a binary specification shall include information specific to the computer processor architecture for which it is intended, it is not possible for a single document to specify the interface for all possible LSB-conforming implementations. Therefore, the LSB is a family of specifications, rather than a single one.

This document should be used in conjunction with the documents it references. This document enumerates the system components it includes, but descriptions of those components may be included entirely or partly in this document, partly in other documents, or entirely in other reference documents. For example, the section that describes system service routines includes a list of the system routines supported in this interface, formal declarations of the data structures they use that are visible to applications, and a pointer to the underlying referenced specification for information about the syntax and semantics of each call. Only those routines not described in standards referenced by this document, or extensions to those standards, are described in the detail. Information referenced in this way is as much a part of this document as is the information explicitly included here.

The specification carries a version number of either the form $x.y$ or $x.y.z$. This version number carries the following meaning:

- The first number (x) is the major version number. All versions with the same major version number should share binary compatibility. Any addition or deletion of a new library results in a new version number. Interfaces marked as deprecated may be removed from the specification at a major version change.
- The second number (y) is the minor version number. Individual interfaces may be added if all certified implementations already had that (previously undocumented) interface. Interfaces may be marked as deprecated at a minor version change. Other minor changes may be permitted at the discretion of the LSB workgroup.
- The third number (z), if present, is the editorial level. Only editorial changes should be included in such versions.

Since this specification is a descriptive Application Binary Interface, and not a source level API specification, it is not possible to make a guarantee of 100% backward compatibility between major releases. However, it is the intent that those parts of the binary interface that are visible in the source level API will remain backward compatible from version to version, except where a feature marked as "Deprecated" in one release may be removed from a future release.

Implementors are strongly encouraged to make use of symbol versioning to permit simultaneous support of applications conforming to different releases of this specification.

I Introductory Elements

1 Scope

1.1 General

The Linux Standard Base (LSB) defines a system interface for compiled applications and a minimal environment for support of installation scripts. Its purpose is to enable a uniform industry standard environment for high-volume applications conforming to the LSB.

These specifications are composed of two basic parts: A common specification ("LSB-generic" or "generic LSB"), ISO/IEC 23360 Part 1, describing those parts of the interface that remain constant across all implementations of the LSB, and an architecture-specific part ("LSB-arch" or "archLSB") describing the parts of the interface that vary by processor architecture. Together, the LSB-generic and the relevant architecture-specific part of ISO/IEC 23360 for a single hardware architecture provide a complete interface specification for compiled application programs on systems that share a common hardware architecture.

ISO/IEC 23360 Part 1, the LSB-generic document, should be used in conjunction with an architecture-specific part. Whenever a section of the LSB-generic specification is supplemented by architecture-specific information, the LSB-generic document includes a reference to the architecture part. Architecture-specific parts of ISO/IEC 23360 may also contain additional information that is not referenced in the LSB-generic document.

The LSB contains both a set of Application Program Interfaces (APIs) and Application Binary Interfaces (ABIs). APIs may appear in the source code of portable applications, while the compiled binary of that application may use the larger set of ABIs. A conforming implementation provides all of the ABIs listed here. The compilation system may replace (e.g. by macro definition) certain APIs with calls to one or more of the underlying binary interfaces, and may insert calls to binary interfaces as needed.

The LSB is primarily a binary interface definition. Not all of the source level APIs available to applications may be contained in this specification.

1.2 Module Specific Scope

This is the Itanium™ architecture specific Core part of the Linux Standard Base (LSB). This part supplements the generic LSB Core module with those interfaces that differ between architectures.

Interfaces described in this part of ISO/IEC 23360 are mandatory except where explicitly listed otherwise. Core interfaces may be supplemented by other modules; all modules are built upon the core.

2 References

2.1 Normative References

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

Note: Where copies of a document are available on the World Wide Web, a Uniform Resource Locator (URL) is given for informative purposes only. This may point to a more recent copy of the referenced specification, or may be out of date. Reference copies of specifications at the revision level indicated may be found at the Linux Foundation's Reference Specifications (<http://refspecs.freestandards.org>) site.

3 Requirements

3.1 Relevant Libraries

The libraries listed in [Table 3-1](#) shall be available on IA64 Linux Standard Base systems, with the specified runtime names. These names override or supplement the names specified in the generic LSB (ISO/IEC 23360 Part 1) specification. The specified program interpreter, referred to as proginterp in this table, shall be used to load the shared libraries specified by DT_NEEDED entries at runtime.

Table 3-1 Standard Library Names

Library	Runtime Name
libm	libm.so.6.1
libdl	libdl.so.2
libcrypt	libcrypt.so.1
libz	libz.so.1
libncurses	libncurses.so.5
libutil	libutil.so.1
libc	libc.so.6.1
libpthread	libpthread.so.0
proginterp	/lib/ld-lsb-ia64.so.3
libgcc_s	libgcc_s.so.1

These libraries will be in an implementation-defined directory which the dynamic linker shall search by default.

3.2 LSB Implementation Conformance

A conforming implementation is necessarily architecture specific, and must provide the interfaces specified by both the generic LSB Core specification (ISO/IEC 23360 Part 1) and the relevant architecture specific part of ISO/IEC 23360.

Rationale: An implementation must provide *at least* the interfaces specified in these specifications. It may also provide additional interfaces.

A conforming implementation shall satisfy the following requirements:

- A processor architecture represents a family of related processors which may not have identical feature sets. The architecture specific parts of ISO/IEC 23360 that supplement this specification for a given target processor architecture describe a minimum acceptable processor. The implementation shall provide all features of this processor, whether in hardware or through emulation transparent to the application.
- The implementation shall be capable of executing compiled applications having the format and using the system interfaces described in this document.
- The implementation shall provide libraries containing the interfaces specified by this document, and shall provide a dynamic linking mechanism that allows these interfaces to be attached to applications at runtime. All the inter-

faces shall behave as specified in this document.

- The map of virtual memory provided by the implementation shall conform to the requirements of this document.
- The implementation's low-level behavior with respect to function call linkage, system traps, signals, and other such activities shall conform to the formats described in this document.
- The implementation shall provide all of the mandatory interfaces in their entirety.
- The implementation may provide one or more of the optional interfaces. Each optional interface that is provided shall be provided in its entirety. The product documentation shall state which optional interfaces are provided.
- The implementation shall provide all files and utilities specified as part of this document in the format defined here and in other referenced documents. All commands and utilities shall behave as required by this document. The implementation shall also provide all mandatory components of an application's runtime environment that are included or referenced in this document.
- The implementation, when provided with standard data formats and values at a named interface, shall provide the behavior defined for those values and data formats at that interface. However, a conforming implementation may consist of components which are separately packaged and/or sold. For example, a vendor of a conforming implementation might sell the hardware, operating system, and windowing system as separately packaged items.
- The implementation may provide additional interfaces with different names. It may also provide additional behavior corresponding to data values outside the standard ranges, for standard named interfaces.

3.3 LSB Application Conformance

A conforming application is necessarily architecture specific, and must conform to both the generic LSB Core specification (ISO/IEC 23360 Part 1) and the relevant architecture specific part of ISO/IEC 23360.

A conforming application shall satisfy the following requirements:

- Its executable files shall be either shell scripts or object files in the format defined for the Object File Format system interface.
- Its object files shall participate in dynamic linking as defined in the Program Loading and Linking System interface.
- It shall employ only the instructions, traps, and other low-level facilities defined in the Low-Level System interface as being for use by applications.
- If it requires any optional interface defined in this document in order to be installed or to execute successfully, the requirement for that optional interface shall be stated in the application's documentation.
- It shall not use any interface or data format that is not required to be provided by a conforming implementation, unless:
 - If such an interface or data format is supplied by another application through direct invocation of that application during execution, that application shall be in turn an LSB conforming application.
 - The use of that interface or data format, as well as its source, shall be identi-

fied in the documentation of the application.

- It shall not use any values for a named interface that are reserved for vendor extensions.

A strictly conforming application shall not require or use any interface, facility, or implementation-defined extension that is not defined in this document in order to be installed or to execute successfully.

4 Definitions

For the purposes of this document, the following definitions, as specified in the *ISO/IEC Directives, Part 2, 2001, 4th Edition*, apply:

can

be able to; there is a possibility of; it is possible to

cannot

be unable to; there is no possibility of; it is not possible to

may

is permitted; is allowed; is permissible

need not

it is not required that; no...is required

shall

is to; is required to; it is required that; has to; only...is permitted; it is necessary

shall not

is not allowed [permitted] [acceptable] [permissible]; is required to be not; is required that...be not; is not to be

should

it is recommended that; ought to

should not

it is not recommended that; ought not to

5 Terminology

For the purposes of this document, the following terms apply:

archLSB

The architectural part of the LSB Specification which describes the specific parts of the interface that are platform specific. The archLSB is complementary to the gLSB.

Binary Standard

The total set of interfaces that are available to be used in the compiled binary code of a conforming application.

gLSB

The common part of the LSB Specification that describes those parts of the interface that remain constant across all hardware implementations of the LSB.

implementation-defined

Describes a value or behavior that is not defined by this document but is selected by an implementor. The value or behavior may vary among implementations that conform to this document. An application should not rely on the existence of the value or behavior. An application that relies on such a value or behavior cannot be assured to be portable across conforming implementations. The implementor shall document such a value or behavior so that it can be used correctly by an application.

Shell Script

A file that is read by an interpreter (e.g., awk). The first line of the shell script includes a reference to its interpreter binary.

Source Standard

The set of interfaces that are available to be used in the source code of a conforming application.

undefined

Describes the nature of a value or behavior not defined by this document which results from use of an invalid program construct or invalid data input. The value or behavior may vary among implementations that conform to this document. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming implementations.

unspecified

Describes the nature of a value or behavior not specified by this document which results from use of a valid program construct or valid data input. The value or behavior may vary among implementations that conform to this document. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming

implementations.

Other terms and definitions used in this document shall have the same meaning as defined in Chapter 3 of the Base Definitions volume of [ISO POSIX \(2003\)](#).

6 Documentation Conventions

Throughout this document, the following typographic conventions are used:

function()
the name of a function

command
the name of a command or utility

CONSTANT
a constant value

parameter
a parameter

variable
a variable

Throughout this specification, several tables of interfaces are presented. Each entry in these tables has the following format:

name
the name of the interface
(symver)
An optional symbol version identifier, if required.

[refno]
A reference number indexing the table of referenced specifications that follows this table.

For example,

forkpty(GLIBC_2.0) [SUSv3]

refers to the interface named **forkpty()** with symbol version **GLIBC_2.0** that is defined in the SUSv3 reference.

Note: For symbols with versions which differ between architectures, the symbol versions are defined in the architecture specific parts of ISO/IEC 23360 only.

II Executable and Linking Format (ELF)

7 Introduction

Executable and Linking Format (ELF) defines the object format for compiled applications. This specification supplements the information found in [System V ABI Update](#) and [Intel® Itanium™ Processor-specific Application Binary Interface](#), and is intended to document additions made since the publication of that document.

8 Low Level System Information

8.1 Machine Interface

8.1.1 Processor Architecture

The Itanium™ Architecture is specified by the following documents

- [Itanium™ Architecture Software Developer's Manual Volume 1](#)
- [Itanium™ Architecture Software Developer's Manual Volume 2](#)
- [Itanium™ Architecture Software Developer's Manual Volume 3](#)
- [Itanium™ Architecture Software Developer's Manual Volume 4](#)
- [Itanium™ Software Conventions and Runtime Guide](#)
- [Intel® Itanium™ Processor-specific Application Binary Interface](#)

Only the features of the Itanium™ processor instruction set may be assumed to be present. An application should determine if any additional instruction set features are available before using those additional features. If a feature is not present, then the application may not use it.

Conforming applications may use only instructions which do not require elevated privileges.

Conforming applications shall not invoke the implementations underlying system call interface directly. The interfaces in the implementation base libraries shall be used instead.

Rationale: Implementation-supplied base libraries may use the system call interface but applications must not assume any particular operating system or kernel version is present.

There are some features of the Itanium™ processor architecture that need not be supported by a conforming implementation. These are described in this chapter. A conforming application shall not rely on these features.

Applications conforming to this specification must provide feedback to the user if a feature that is required for correct execution of the application is not present. Applications conforming to this specification should attempt to execute in a diminished capacity if a required feature is not present.

This specification does not provide any performance guarantees of a conforming system. A system conforming to this specification may be implemented in either hardware or software.

This specification describes only LP64 (i.e. 32-bit integers, 64-bit longs and pointers) based implementations. Implementations may also provide ILP32 (32-bit integers, longs, and pointers), but conforming applications shall not rely on support for ILP32. See section 1.2 of the [Intel® Itanium™ Processor-specific Application Binary Interface](#) for further information.

8.1.2 Data Representation

The following sections, in conjunction with section 4 of [Itanium™ Software Conventions and Runtime Guide](#), define the size, alignment requirements, and hardware representation of the standard C data types.

Within this specification, the term byte refers to an 8-bit object, the term half-word refers to a 16-bit object, the term word refers to a 32-bit object, the term doubleword refers to a 64-bit object, and the term quadword refers to a 128-bit object.

8.1.2.1 Byte Ordering

LSB-conforming applications shall use little-endian byte ordering. LSB-conforming implementations may support big-endian applications.

8.1.2.2 Fundamental Types

[Table 8-1](#) describes how fundamental C language data types shall be represented:

Table 8-1 Scalar Types

Type	C	sizeof	Alignment (bytes)	Hardware Representation
Integral	_Bool	1	1	byte (sign unspecified)
	char	1	1	signed byte
	signed char			
	unsigned char	2	2	signed byte
	short			
	signed short	4	4	signed half-word
	unsigned short			
	int			unsigned halfword
	signed int			
	unsigned int	8	8	signed word
	long			
	signed long			
	unsigned long	8	8	unsigned doubleword
	long long			
	signed long long			
	unsigned long long	8	8	signed doubleword
Pointer	any-type *			

	<i>any-type</i> (*)()			
Floating-Point	float	4	4	IEEE Single-precision
	double	8	8	IEEE Double-precision
	long double	16	16	IEEE Double-extended

A null pointer (for all types) shall have the value zero.

8.1.2.3 Aggregates and Unions

Aggregates (structures and arrays) and unions assume the alignment of their most strictly aligned component. The size of any object, including aggregates and unions, shall always be a multiple of the object's alignment. An array uses the same alignment as its elements. Structure and union objects may require padding to meet size and element constraints. The contents of such padding is undefined.

- An entire structure or union object shall be aligned on the same boundary as its most strictly aligned member.
- Each member shall be assigned to the lowest available offset with the appropriate alignment. This may require *internal padding*, depending on the previous member.
- A structure's size shall be increased, if necessary, to make it a multiple of the alignment. This may require *tail padding*, depending on the last member.

A conforming application shall not read padding.

<pre>struct { char c; }</pre>	Byte aligned, sizeof is 1	
Offset	Byte 0	
0	c ⁰	

Figure 8-1 Structure Smaller Than A Word

<pre>struct { char c; char d; short s; int i; long l; }</pre>	Doubleword Aligned, sizeof is 16			
Offset	Byte 3	Byte 2	Byte 1	Byte 0
0	s ²		d ¹	c ⁰

8.1.2.4 Bit Fields

C struct and union definitions may have *bit-fields*, which define integral objects with a specified number of bits.

Bit fields that are declared with neither signed nor unsigned specifier shall always be treated as unsigned. Bit fields obey the same size and alignment rules as other structure and union members, with the following additional properties:

- Bit-fields are allocated from right to left (least to most significant).
- A bit-field must entirely reside in a storage unit for its appropriate type. A bit field shall never cross its unit boundary.
- Bit-fields may share a storage unit with other struct/union members, including members that are not bit fields. Such other struct/union members shall occupy different parts of the storage unit.
- The type of unnamed bit-fields shall not affect the alignment of a structure or union, although individual bit-field member offsets shall obey the alignment constraints.

Bit-field Type	Width w	Range
signed char char unsigned char	1 to 8	- 2^{w-1} to $2^{w-1}-1$ 0 to 2^w-1 0 to 2^w-1
signed short short unsigned short	1 to 16	- 2^{w-1} to $2^{w-1}-1$ 0 to 2^w-1 0 to 2^w-1
signed int int unsigned int	1 to 32	- 2^{w-1} to $2^{w-1}-1$ 0 to 2^w-1 0 to 2^w-1

signed long long unsigned long	1 to 64	-2^{w-1} to $2^{w-1}-1$ 0 to 2^w-1 0 to 2^w-1
--------------------------------------	---------	---

Figure 8-4 Bit-Field Ranges

8.2 Function Calling Sequence

LSB-conforming applications shall use the procedure linkage and function calling sequence as defined in Chapter 8.4 of the [Itanium™ Software Conventions and Runtime Guide](#).

8.2.1 Registers

The CPU general and other registers are as defined in the [Itanium™ Architecture Software Developer's Manual Volume 1](#) Section 3.1.

8.2.2 Floating Point Registers

The floating point registers are as defined in the [Itanium™ Architecture Software Developer's Manual Volume 1](#) Section 3.1.

8.2.3 Stack Frame

The stackframe layout is as described in the [Itanium™ Software Conventions and Runtime Guide](#) Chapter 8.4.

8.2.4 Arguments

8.2.4.1 Introduction

The procedure parameter passing mechanism is as described in the [Itanium™ Software Conventions and Runtime Guide](#) Chapter 8.5. The following subsections provide additional information.

8.2.4.2 Integral/Pointer

See [Itanium™ Software Conventions and Runtime Guide](#) Chapter 8.5.

8.2.4.3 Floating Point

See [Itanium™ Software Conventions and Runtime Guide](#) Chapter 8.5.

8.2.4.4 Struct and Union Point

See [Itanium™ Software Conventions and Runtime Guide](#) Chapter 8.5.

8.2.4.5 Variable Arguments

See [Itanium™ Software Conventions and Runtime Guide](#) Chapter 8.5.4.

8.2.5 Return Values

8.2.5.1 Introduction

Values are returned from functions as described in [Itanium™ Software](#)

[Conventions and Runtime Guide](#) Chapter 8.6, and as further described here.

8.2.5.2 Void

Functions that return no value (void functions) are not required to put any particular value in any general register.

8.2.5.3 Integral/Pointer

See [Itanium™ Software Conventions and Runtime Guide](#) Chapter 8.6.

8.2.5.4 Floating Point

See [Itanium™ Software Conventions and Runtime Guide](#) Chapter 8.6.

8.2.5.5 Struct and Union

See [Itanium™ Software Conventions and Runtime Guide](#) Chapter 8.6 (aggregate return values). Depending on the size (including any padding), aggregate data types may be passed in one or more general registers, or in memory.

8.3 Operating System Interface

LSB-conforming applications shall use the Operating System Interfaces as defined in Chapter 3 of the [Intel® Itanium™ Processor-specific Application Binary Interface](#).

8.3.1 Processor Execution Mode

Applications must assume that they will execute in the least privileged user mode (i.e. level 3). Other privilege levels are reserved for the Operating System.

8.3.2 Exception Interface

8.3.2.1 Introduction

LSB-conforming implementations shall support the exception interface as specified in [Intel® Itanium™ Processor-specific Application Binary Interface](#), section 3.3.1.

8.3.2.2 Hardware Exception Types

See [Intel® Itanium™ Processor-specific Application Binary Interface](#), section 3.3.1.

8.3.2.3 Software Trap Types

See [Intel® Itanium™ Processor-specific Application Binary Interface](#), section 3.3.1.

8.3.3 Signal Delivery

LSB-conforming systems shall deliver signals as specified in [Intel® Itanium™ Processor-specific Application Binary Interface](#), section 3.3.2.

8.3.3.1 Signal Handler Interface

The signal handler interface shall be as specified in [Intel® Itanium™ Processor-specific Application Binary Interface](#), section 3.3.3.

8.3.4 Debugging Support

The LSB does not specify debugging information.

8.3.5 Process Startup

LSB-conforming systems shall initialize processes as specified in [Intel® Itanium™ Processor-specific Application Binary Interface](#), section 3.3.5.

8.4 Process Initialization

LSB-conforming applications shall use the Process Startup as defined in Section 3.3.5 of the [Intel® Itanium™ Processor-specific Application Binary Interface](#).

8.4.1 Special Registers

[Intel® Itanium™ Processor-specific Application Binary Interface](#), section 3.3.5, defines required register initializations for process startup.

8.4.2 Process Stack (on entry)

As defined in [Intel® Itanium™ Processor-specific Application Binary Interface](#), section 3.3.5, the return pointer register (rp) shall contain a valid return address, such that if the application program returns from the main entry routine, the implementation shall cause the application to exit normally, using the returned value as the exit status. Further, the unwind information for this "bottom of stack" routine in the implementation shall provide a mechanism for recognizing the bottom of the stack during a stack unwind.

8.4.3 Auxiliary Vector

The auxiliary vector conveys information from the operating system to the application. Only the terminating null auxiliary vector entry is required, but if any other entries are present, they shall be interpreted as follows. This vector is an array of the following structures.

```
typedef struct
{
    long int a_type;           /* Entry type */
    union
    {
        long int a_val;         /* Integer value */
        void *a_ptr;            /* Pointer value */
        void (*a_fcn) (void);   /* Function pointer value */
    } a_un;
} auxv_t;
```

The application shall interpret the a_un value according to the a_type. Other auxiliary vector types are reserved.

The a_type field shall contain one of the following values:

AT_NULL

The last entry in the array has type AT_NULL. The value in a_un is undefined.

AT_IGNORE

The value in a_un is undefined, and should be ignored.

AT_EXECFD

File descriptor of program

AT_PHDR

Program headers for program

AT_PHENT

Size of program header entry

AT_PHNUM

Number of program headers

AT_PAGESZ

System page size

AT_BASE

Base address of interpreter

AT_FLAGS

Flags

AT_ENTRY

Entry point of program

AT_NOTEFL

Program is not ELF

AT_UID

Real uid

AT_EUID

Effective uid

AT_GID

Real gid

AT_EGID

Effective gid

AT_CLKTCK

Frequency of times()

AT_PLATFORM

String identifying platform.

AT_HWCAP

Machine dependent hints about processor capabilities.

AT_FPUCW

Used FPU control word

AT_DCACHEBSIZE

Data cache block size

AT_ICACHEBSIZE

Instruction cache block size

AT_UCACHEBSIZE

Unified cache block size

Note: The auxiliary vector is intended for passing information from the operating system to the program interpreter.

8.4.4 Environment

Although a pointer to the environment vector should be available as a third argument to the `main()` entry point, conforming applications should use `getenv()` to access the environment. (See [ISO POSIX \(2003\)](#), Section `exec()`).

8.5 Coding Examples

8.5.1 Introduction

LSB-conforming applications may implement fundamental operations using the Coding Examples as shown below.

Sample code sequences and coding conventions can be found in [Itanium™ Software Conventions and Runtime Guide](#), Chapter 9.

8.5.2 Code Model Overview/Architecture Constraints

As defined in [Intel® Itanium™ Processor-specific Application Binary Interface](#), relocatable files, executable files, and shared object files that are supplied as part of an application shall use Position Independent Code, as described in [Itanium™ Software Conventions and Runtime Guide](#), Chapter 12.

8.5.3 Position-Independent Function Prologue

See [Itanium™ Software Conventions and Runtime Guide](#), Chapter 8.4.

8.5.4 Data Objects

See [Intel® Itanium™ Processor-specific Application Binary Interface](#), Chapter 5.3.4, and [Itanium™ Software Conventions and Runtime Guide](#), Chapter 12.3.

8.5.4.1 Absolute Load & Store

Conforming applications shall not use absolute addressing.

8.5.4.2 Position Relative Load & Store

See [Intel® Itanium™ Processor-specific Application Binary Interface](#), Chapter 5.3.4.

8.5.5 Function Calls

See [Itanium™ Software Conventions and Runtime Guide](#), Chapter 8.4.

Four types of procedure call are defined in [Itanium™ Software Conventions and Runtime Guide](#), Chapter 8.3. Although special calling conventions are permitted, provided that the compiler and runtime library agree on these conventions, none are defined for this standard. Consequently, no application shall depend on a type of procedure call other than Direct Calls, Direct Dynamically Linked Calls, or Indirect Calls, as defined in [Itanium™ Software Conventions and Runtime Guide](#), Chapter 8.3.

8.5.5.1 Absolute Direct Function Call

Conforming applications shall not use absolute addressing.

8.5.5.2 Absolute Indirect Function Call

Conforming applications shall not use absolute addressing.

8.5.5.3 Position-Independent Direct Function Call

See [Itanium™ Software Conventions and Runtime Guide](#), Chapter 8.4.1.

8.5.5.4 Position-Independent Indirect Function Call

See [Itanium™ Software Conventions and Runtime Guide](#), Chapter 8.4.2.

8.5.6 Branching

Branching is described in [Itanium™ Architecture Software Developer's Manual Volume 4](#), Chapter 4.5.

8.5.6.1 Branch Instruction

See [Itanium™ Architecture Software Developer's Manual Volume 4](#), Chapter 4.5.

8.5.6.2 Absolute switch() code

Conforming applications shall not use absolute addressing.

8.5.6.3 Position-Independent switch() code

Where there are several possible targets for a branch, the compiler may use a number of different code generation strategies. See [Itanium™ Software Conventions and Runtime Guide](#), Chapter 9.1.7.

8.6 C Stack Frame

8.6.1 Variable Argument List

See [Itanium™ Software Conventions and Runtime Guide](#), Chapter 8.5.2, and 8.5.4.

8.6.2 Dynamic Allocation of Stack Space

The C library `alloca()` function should be used to dynamically allocate stack space.

8.7 Debug Information

The LSB does not currently specify the format of Debug information.

9 Object Format

9.1 Introduction

LSB-conforming implementations shall support an object file format, called Executable and Linking Format (ELF) as defined by the [System V ABI](#), [Intel® Itanium™ Processor-specific Application Binary Interface](#) and as supplemented by the Linux Standard Base Specification and this document.

9.2 ELF Header

9.2.1 Machine Information

LSB-conforming applications shall use the Machine Information as defined in [Intel® Itanium™ Processor-specific Application Binary Interface](#), Chapter 4. Implementations shall support the LP64 model. It is unspecified whether or not the ILP32 model shall also be supported.

9.2.1.1 File Class

For LP64 relocatable objects, the file class value in `e_ident[EI_CLASS]` may be either `ELFCLASS32` or `ELFCLASS64`, and a conforming linker must be able to process either or both classes.

9.2.1.2 Data Encoding

Implementations shall support 2's complement, little endian data encoding. The data encoding value in `e_ident[EI_DATA]` shall contain the value `ELFDATA2LSB`.

9.2.1.3 OS Identification

The OS Identification field `e_ident[EI_OSABI]` shall contain the value `ELFOS-ABI_NONE`.

9.2.1.4 Processor Identification

The processor identification value held in `e_machine` shall contain the value `EM_IA_64`.

9.2.1.5 Processor Specific Flags

The flags field `e_flags` shall be as described in [Intel® Itanium™ Processor-specific Application Binary Interface](#), Chapter 4.1.1.6.

The following additional processor-specific flags are defined:

Table 9-1 Additional Processor-Specific Flags

Name	Value
<code>EF_IA_64_LINUX_EXECUTABLE_STACK</code>	0x00000001

`EF_IA_64_LINUX_EXECUTABLE_STACK`

The stack and heap sections are executable. If this flag is not set, code can not be executed from the stack or heap.

9.3 Sections

The Itanium™ architecture defines two processor-specific section types, as described in [Intel® Itanium™ Processor-specific Application Binary Interface](#), Chapter 4.

9.3.1 Special Sections

The following sections are defined in the [Intel® Itanium™ Processor-specific Application Binary Interface](#).

Table 9-2 ELF Special Sections

Name	Type	Attributes
.got	SHT_PROGBITS	SHF_ALLOC+SHF_WRITE+SHF_IA_64_SHORT
.IA_64.archext	SHT_IA_64_EXT	0
.IA_64.pltoff	SHT_PROGBITS	SHF_ALLOC+SHF_WRITE+SHF_IA_64_SHORT
.IA_64.unwind	SHT_IA_64_UNWIND	SHF_ALLOC+SHF_LINNK_ORDER
.IA_64.unwind_info	SHT_PROGBITS	SHF_ALLOC
.plt	SHT_PROGBITS	SHF_ALLOC+SHF_EXECINSTR
.sbss	SHT_NOBITS	SHF_ALLOC+SHF_WRITE+SHF_IA_64_SHORT
.sdata	SHT_PROGBITS	SHF_ALLOC+SHF_WRITE+SHF_IA_64_SHORT
.sdata1	SHT_PROGBITS	SHF_ALLOC+SHF_WRITE+SHF_IA_64_SHORT

.got

This section holds the Global Offset Table. See 'Coding Examples' in Chapter 3, 'Special Sections' in Chapter 4, and 'Global Offset Table' in Chapter 5 of the processor supplement for more information.

.IA_64.archext

This section holds product-specific extension bits. The link editor will perform a logical "or" of the extension bits of each object when creating an executable so that it creates only a single .IA_64.archext section in the executable.

.IA_64.pltoff

This section holds local function descriptor entries.

.IA_64.unwind

This section holds the unwind function table. The contents are described in the Intel (r) Itanium (tm) Processor Specific ABI.

.IA_64.unwind_info

This section holds stack unwind and exception handling information. The exception handling information is programming language specific, and is unspecified.

.plt

This section holds the procedure linkage table.

.sbss

This section holds uninitialized data that contribute to the program's memory image. Data objects contained in this section are recommended to be eight bytes or less in size. The system initializes the data with zeroes when the program begins to run. The section occupies no file space, as indicated by the section type SHT_NOBITS. The .sbss section is placed so it may be accessed using short direct addressing (22 bit offset from gp).

.sdata

This section and the .sdata1 section hold initialized data that contribute to the program's memory image. Data objects contained in this section are recommended to be eight bytes or less in size. The .sdata and .sdata1 sections are placed so they may be accessed using short direct addressing (22 bit offset from gp).

.sdata1

See .sdata.

9.3.2 Linux Special Sections

The following Linux IA-64 specific sections are defined here.

Table 9-3 Additional Special Sections

Name	Type	Attributes
.opd	SHT_PROGBITS	SHF_ALLOC
.rela.dyn	SHT_REL	SHF_ALLOC
.rela.IA_64.pltoff	SHT_REL	SHF_ALLOC

.opd

This section holds function descriptors.

.rela.dyn

This section holds RELA type relocation information for all sections of a shared library except the PLT.

.rela.IA_64.pltoff

This section holds relocation information, as described in 'Relocation' section in Chapter 4 of System V ABI Update. These relocations are applied to the .IA_64.pltoff section.

9.3.3 Section Types

Section Types are described in the [Intel® Itanium™ Processor-specific Application Binary Interface](#), Chapter 4.2. LSB conforming implementations are not required to use any sections in the range from SHT_IA_64_LOPSREG to SHT_IA_64_HIPSREG. Additionally, LSB conforming implementations are not required to support the SHT_IA_64_PRIORITY_INIT section, beyond the gABI requirements for the handling of unrecognized section types, linking them into a contiguous section in the object file created by the static linker.

9.3.4 Section Attribute Flags

LSB-conforming implementations shall support the section attribute flags specified in [Intel® Itanium™ Processor-specific Application Binary Interface](#), Chapter 4.2.2.

9.3.5 Special Section Types

The special section types SHT_IA64_EXT and SHT_IA64_UNWIND are defined in [Intel® Itanium™ Processor-specific Application Binary Interface](#), Chapter 4.2.1.

9.4 Symbol Table

If an executable file contains a reference to a function defined in one of its associated shared objects, the symbol table section for that file shall contain an entry for that symbol. The *st_shndx* member of that symbol table entry contains *SHN_UNDEF*. This signals to the dynamic linker that the symbol definition for that function is not contained in the executable file itself. If that symbol has been allocated a procedure linkage table entry in the executable file, and the *st_value* member for that symbol table entry is non-zero, the value shall contain the virtual address of the first instruction of that procedure linkage table entry. Otherwise, the *st_value* member contains zero. This procedure linkage table entry address is used by the dynamic linker in resolving references to the address of the function.

9.5 Relocation

9.5.1 Relocation Types

LSB-conforming systems shall support the relocation types described in [Intel® Itanium™ Processor-specific Application Binary Interface](#), Chapter 4.3.

10 Program Loading and Dynamic Linking

10.1 Introduction

LSB-conforming implementations shall support the object file information and system actions that create running programs as specified in the [System V ABI](#), [Intel® Itanium™ Processor-specific Application Binary Interface](#) and as supplemented by the Linux Standard Base Specification and this document.

10.2 Program Header

The program header shall be as defined in the [Intel® Itanium™ Processor-specific Application Binary Interface](#), Chapter 5.

10.2.1 Types

See [Intel® Itanium™ Processor-specific Application Binary Interface](#), Chapter 5.1.

10.2.2 Flags

See [Intel® Itanium™ Processor-specific Application Binary Interface](#), Chapter 5.1.

10.3 Program Loading

See [Intel® Itanium™ Processor-specific Application Binary Interface](#), Chapter 5.2.

10.4 Dynamic Linking

See [Intel® Itanium™ Processor-specific Application Binary Interface](#), Chapter 5.3.

10.4.1 Dynamic Entries

10.4.1.1 ELF Dynamic Entries

The following dynamic entries are defined in the [Intel® Itanium™ Processor-specific Application Binary Interface](#), Chapter 5.3.2.

DT_PLTGOT

This entry's d_ptr member gives the address of the first byte in the procedure linkage table

10.4.1.2 Additional Dynamic Entries

The following dynamic entries are defined here.

DT_RELACOUNT

The number of relative relocations in .rela.dyn

10.4.2 Global Offset Table

See [Intel® Itanium™ Processor-specific Application Binary Interface](#), Chapter

5.3.4.

10.4.3 Shared Object Dependencies

See [Intel® Itanium™ Processor-specific Application Binary Interface](#), Chapter 5.3.3.

10.4.4 Function Addresses

See [Intel® Itanium™ Processor-specific Application Binary Interface](#), Chapter 5.3.5.

10.4.5 Procedure Linkage Table

See [Intel® Itanium™ Processor-specific Application Binary Interface](#), Chapter 5.3.6.

10.4.6 Initialization and Termination Functions

See [Intel® Itanium™ Processor-specific Application Binary Interface](#), Chapter 5.3.7.

III Base Libraries

11 Libraries

An LSB-conforming implementation shall support base libraries which provide interfaces for accessing the operating system, processor and other hardware in the system.

Only those interfaces that are unique to the Itanium™ platform are defined here. This section should be used in conjunction with the corresponding section in the Linux Standard Base Specification.

11.1 Program Interpreter/Dynamic Linker

The Program Interpreter shall be [/lib/ld-lsb-ia64.so.3](#).

11.2 Interfaces for libc

[Table 11-1](#) defines the library name and shared object name for the libc library

Table 11-1 libc Definition

Library:	libc
SONAME:	libc.so.6.1

The behavior of the interfaces in this library is specified by the following specifications:

- [LFS] [Large File Support](#)
- [LSB] [ISO/IEC 23360 Part 1](#)
- [RPC & XDR] [RFC 1831/1832 RPC & XDR](#)
- [SUSv2] [SUSv2](#)
- [SUSv3] [ISO POSIX \(2003\)](#)
- [SUSv4] [POSIX 1003.1 2008](#)
- [SVID.3] [SVID Issue 3](#)
- [SVID.4] [SVID Issue 4](#)

11.2.1 RPC

11.2.1.1 Interfaces for RPC

An LSB conforming implementation shall provide the architecture specific functions for RPC specified in [Table 11-2](#), with the full mandatory functionality as described in the referenced underlying specification.

Table 11-2 libc - RPC Function Interfaces

authnone_create(GLIBC_2.2) [SVID.4]	callrpc(GLIBC_2.2) [RPC & XDR]	clnt_create(GLIBC_2.2) [SVID.4]	clnt_pcreateerror(GLIBC_2.2) [SVID.4]

xdr_wrapstring(GLIBC_2.2) [SVID.3]	xdrmem_create(GLIBC_2.2) [SVID.3]	xdrrec_create(GLIBC_2.2) [SVID.3]	xdrrec_endofrec ord(GLIBC_2.2) [RPC & XDR]
xdrrec_eof(GLIBC_2.2) [SVID.3]	xdrrec_skiprecord(GLIBC_2.2) [RPC & XDR]	xdrstdio_create(GLIBC_2.2) [LSB]	

An LSB conforming implementation shall provide the architecture specific deprecated functions for RPC specified in [Table 11-3](#), with the full mandatory functionality as described in the referenced underlying specification.

Note: These interfaces are deprecated, and applications should avoid using them. These interfaces may be withdrawn in future releases of this specification.

Table 11-3 libc - RPC Deprecated Function Interfaces

key_decryptsession(GLIBC_2.2) [SVID.3]			
---	--	--	--

11.2.2 Epoll

11.2.2.1 Interfaces for Epoll

No external functions are defined for libc - Epoll in this part of the specification. See also the generic specification.

11.2.3 System Calls

11.2.3.1 Interfaces for System Calls

An LSB conforming implementation shall provide the architecture specific functions for System Calls specified in [Table 11-4](#), with the full mandatory functionality as described in the referenced underlying specification.

Table 11-4 libc - System Calls Function Interfaces

<code>__fxstat(GLIBC_2.2) [LSB]</code>	<code>__getpgid(GLIBC_C_2.2) [LSB]</code>	<code>__lxstat(GLIBC_2.2) [LSB]</code>	<code>__xmknod(GLIBC_C_2.2) [LSB]</code>

An LSB conforming implementation shall provide the architecture specific deprecated functions for Standard Library specified in [Table 11-33](#), with the full mandatory functionality as described in the referenced underlying specification.

Note: These interfaces are deprecated, and applications should avoid using them. These interfaces may be withdrawn in future releases of this specification.

11.3 Data Definitions for libc

This section defines global identifiers and their values that are associated with interfaces contained in libc. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the [ISO C \(1999\)](#) C Language as the reference programming language, and data definitions are specified in ISO C format. The C lan-

guage is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

11.3.1 assert.h

11.4 Interfaces for libm

[Table 11-35](#) defines the library name and shared object name for the libm library

Table 11-35 libm Definition

Library:	libm
SONAME:	libm.so.6.1

The behavior of the interfaces in this library is specified by the following specifications:

- [LSB] [ISO/IEC 23360 Part 1](#)
- [SUSv3] [ISO POSIX \(2003\)](#)
- [SVID.3] [SVID Issue 3](#)

11.4.1 Math

11.4.1.1 Interfaces for Math

An LSB conforming implementation shall provide the architecture specific functions for Math specified in [Table 11-36](#), with the full mandatory functionality as described in the referenced underlying specification.

Table 11-36 libm - Math Function Interfaces

11.5 Data Definitions for libm

This section defines global identifiers and their values that are associated with interfaces contained in libm. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the [ISO C \(1999\)](#) C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

11.5.1 complex.h

```
/*
 * This header is architecture neutral
 * Please refer to the generic specification for details
 */
```

11.5.2 fenv.h

```

#define FE_INVALID      (1UL << 0)

```

11.6 Interface Definitions for libm

The interfaces defined on the following pages are included in libm and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in [Section 11.4](#) shall behave as described in the referenced base document. For interfaces referencing LSB and not listed below, please see the generic part of the specification.

__fpclassifyl

Name

`__fpclassifyl` — Classify real floating type

Synopsis

```
int __fpclassifyl(long double arg);
```

Description

`__fpclassifyl()` has the same specification as `fpclassify()` in [ISO POSIX \(2003\)](#), except that the argument type for `__fpclassifyl()` is known to be long double.

`__fpclassifyl()` is not in the source standard; it is only in the binary standard.

__signbitl

Name

`__signbitl` — test sign of floating point value

Synopsis

```
#include <math.h>
int __signbitl(long double arg);
```

Description

`__signbitl()` has the same specification as `signbit()` in [ISO POSIX \(2003\)](#), except that the argument type for `__signbitl()` is known to be long double.

`__signbitl()` is not in the source standard; it is only in the binary standard.

11.7 Interfaces for libpthread

[Table 11-39](#) defines the library name and shared object name for the libpthread library

Table 11-39 libpthread Definition

Library:	libpthread
SONAME:	libpthread.so.0

The behavior of the interfaces in this library is specified by the following specifications:

- [LFS] [Large File Support](#)
- [LSB] [ISO/IEC 23360 Part 1](#)
- [SUSv3] [ISO POSIX \(2003\)](#)

11.7.1 Realtime Threads

11.7.1.1 Interfaces for Realtime Threads

An LSB conforming implementation shall provide the architecture specific functions for Realtime Threads specified in [Table 11-40](#), with the full mandatory functionality as described in the referenced underlying specification.

Table 11-40 libpthread - Realtime Threads Function Interfaces

pthread_attr_get_inheritsched(GLIBC_2.2) [SUSv3]	pthread_attr_get_schedpolicy(GLIBC_2.2) [SUSv3]	pthread_attr_get_scope(GLIBC_2.2) [SUSv3]	pthread_attr_set_inheritsched(GLIBC_2.2) [SUSv3]

11.11 Interface Definitions for libgcc_s

The interfaces defined on the following pages are included in libgcc_s and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in [Section 11.9](#) shall behave as described in the referenced base document. For interfaces referencing LSB and not listed below, please see the generic part of the specification.

_Unwind_DeleteException

Name

`_Unwind_DeleteException` — private C++ error handling method

Synopsis

```
void _Unwind_DeleteException(struct _Unwind_Exception * object);
```

Description

`_Unwind_DeleteException()` deletes the given exception *object*. If a given runtime resumes normal execution after catching a foreign exception, it will not know how to delete that exception. Such an exception shall be deleted by calling `_Unwind_DeleteException()`. This is a convenience function that calls the function pointed to by the *exception_cleanup* field of the exception header.

_Unwind_ForcedUnwind

Name

`_Unwind_ForcedUnwind` — private C++ error handling method

Synopsis

```
_Unwind_Reason_Code _Unwind_ForcedUnwind(struct _Unwind_Exception *  
object, _Unwind_Stop_Fn stop, void * stop_parameter);
```

Description

`_Unwind_ForcedUnwind()` raises an exception for forced unwinding, passing along the given exception *object*, which should have its *exception_class* and *exception_cleanup* fields set. The exception *object* has been allocated by the language-specific runtime, and has a language-specific format, except that it shall contain an `_Unwind_Exception` struct.

Forced unwinding is a single-phase process. *stop* and *stop_parameter* control the termination of the unwind process instead of the usual personality routine query. *stop* is called for each unwind frame, with the parameteres described for the usual personality routine below, plus an additional *stop_parameter*.

Return Value

When *stop* identifies the destination frame, it transfers control to the user code as appropriate without returning, normally after calling `_Unwind_DeleteException()`. If not, then it should return an `_Unwind_Reason_Code` value.

If *stop* returns any reason code other than `_URC_NO_REASON`, then the stack state is indeterminate from the point of view of the caller of `_Unwind_ForcedUnwind()`. Rather than attempt to return, therefore, the unwind library should use the *exception_cleanup* entry in the exception, and then call `abort()`.

`_URC_NO_REASON`

This is not the destination from. The unwind runtime will call frame's personality routine with the `_UA_FORCE_UNWIND` and `_UA_CLEANUP_PHASE` flag set in *actions*, and then unwind to the next frame and call the `stop()` function again.

`_URC_END_OF_STACK`

In order to allow `_Unwind_ForcedUnwind()` to perform special processing when it reaches the end of the stack, the unwind runtime will call it after the last frame is rejected, with a NULL stack pointer in the context, and the `stop()` function shall catch this condition. It may return this code if it cannot handle end-of-stack.

`_URC_FATAL_PHASE2_ERROR`

The `stop()` function may return this code for other fatal conditions like stack corruption.

_Unwind_GetGR

Name

`_Unwind_GetGR` — private C++ error handling method

Synopsis

```
_Unwind_Word _Unwind_GetGR(struct _Unwind_Context * context, int index);
```

Description

`_Unwind_GetGR()` returns data at *index* found in *context*. The register is identified by its index: 0 to 31 are for the fixed registers, and 32 to 127 are for the stacked registers.

During the two phases of unwinding, only GR1 has a guaranteed value, which is the global pointer of the frame referenced by the unwind *context*. If the register has its NAT bit set, the behavior is unspecified.

_Unwind_GetIP

Name

`_Unwind_GetIP` — private C++ error handling method

Synopsis

```
_Unwind_Ptr _Unwind_GetIP(struct _Unwind_Context * context);
```

Description

`_Unwind_GetIP()` returns the instruction pointer value for the routine identified by the unwind *context*.

_Unwind_GetLanguageSpecificData

Name

`_Unwind_GetLanguageSpecificData` — private C++ error handling method

Synopsis

```
_Unwind_Ptr _Unwind_GetLanguageSpecificData(struct _Unwind_Context * context, uint value);
```

Description

`_Unwind_GetLanguageSpecificData()` returns the address of the language specific data area for the current stack frame.

_Unwind_GetRegionStart

Name

`_Unwind_GetRegionStart` — private C++ error handling method

Synopsis

```
_Unwind_Ptr _Unwind_GetRegionStart(struct _Unwind_Context * context);
```

Description

`_Unwind_GetRegionStart()` routine returns the address (i.e., 0) of the beginning of the procedure or code fragment described by the current unwind descriptor block.

_Unwind_RaiseException

Name

`_Unwind_RaiseException` — private C++ error handling method

Synopsis

```
_Unwind_Reason_Code _Unwind_RaiseException(struct _Unwind_Exception
* object);
```

Description

`_Unwind_RaiseException()` raises an exception, passing along the given exception `object`, which should have its `exception_class` and `exception_cleanup` fields set. The exception object has been allocated by the language-specific runtime, and has a language-specific format, exception that it shall contain an `_Unwind_Exception`.

Return Value

`_Unwind_RaiseException()` does not return unless an error condition is found. If an error condition occurs, an `_Unwind_Reason_Code` is returned:

`_URC_END_OF_STACK`

The unwinder encountered the end of the stack during phase one without finding a handler. The unwind runtime will not have modified the stack. The C++ runtime will normally call `uncaught_exception()` in this case.

`_URC_FATAL_PHASE1_ERROR`

The unwinder encountered an unexpected error during phase one, because of something like stack corruption. The unwind runtime will not have modified the stack. The C++ runtime will normally call `terminate()` in this case.

`_URC_FATAL_PHASE2_ERROR`

The unwinder encountered an unexpected error during phase two. This is usually a `throw`, which will call `terminate()`.

_Unwind_Resume

Name

`_Unwind_Resume` — private C++ error handling method

Synopsis

```
void _Unwind_Resume(struct _Unwind_Exception * object);
```

Description

`_Unwind_Resume()` resumes propagation of an existing exception *object*. A call to this routine is inserted as the end of a landing pad that performs cleanup, but does not resume normal execution. It causes unwinding to proceed further.

_Unwind_SetGR

Name

`_Unwind_SetGR` — private C++ error handling method

Synopsis

```
void _Unwind_SetGR(struct _Unwind_Context * context, int index, uint value);
```

Description

`_Unwind_SetGR()` sets the *value* of the register *indexed* for the routine identified by the unwind *context*.

_Unwind_SetIP

Name

`_Unwind_SetIP` — private C++ error handling method

Synopsis

```
void _Unwind_SetIP(struct _Unwind_Context * context, uint value);
```

Description

`_Unwind_SetIP()` sets the *value* of the instruction pointer for the routine identified by the unwind *context*

11.12 Interfaces for libdl

[Table 11-47](#) defines the library name and shared object name for the libdl library

Table 11-47 libdl Definition

Library:	libdl
SONAME:	libdl.so.2

The behavior of the interfaces in this library is specified by the following specifications:

- [LSB] [ISO/IEC 23360 Part 1](#)
- [SUSv3] [ISO POSIX \(2003\)](#)

11.12.1 Dynamic Loader

11.12.1.1 Interfaces for Dynamic Loader

An LSB conforming implementation shall provide the architecture specific functions for Dynamic Loader specified in [Table 11-48](#), with the full mandatory functionality as described in the referenced underlying specification.

Table 11-48 libdl - Dynamic Loader Function Interfaces

dladdr(GLIBC_2.0) [LSB]	dlclose(GLIBC_2.0) [SUSv3]	dlerror(GLIBC_2.0) [SUSv3]	dlopen(GLIBC_2.1) [LSB]
dlsym(GLIBC_2.0) [LSB]			

11.13 Data Definitions for libdl

This section defines global identifiers and their values that are associated with interfaces contained in libdl. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the [ISO C \(1999\)](#) C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

11.13.1 dlfcn.h

```
/*
 * This header is architecture neutral
 * Please refer to the generic specification for details
 */
```

11.14 Interfaces for libcrypt

[Table 11-49](#) defines the library name and shared object name for the libcrypt library

Table 11-49 libcrypt Definition

Library:	libcrypt
SONAME:	libcrypt.so.1

The behavior of the interfaces in this library is specified by the following specifications:

[SUSv3] [ISO POSIX \(2003\)](#)

11.14.1 Encryption

11.14.1.1 Interfaces for Encryption

An LSB conforming implementation shall provide the architecture specific functions for Encryption specified in [Table 11-50](#), with the full mandatory functionality as described in the referenced underlying specification.

Table 11-50 libcrypt - Encryption Function Interfaces

crypt(GLIBC_2.0) [SUSv3]	encrypt(GLIBC_2.0) [SUSv3]	setkey(GLIBC_2.0) [SUSv3]	
---------------------------	----------------------------	---------------------------	--

IV Utility Libraries

12 Libraries

An LSB-conforming implementation shall also support some utility libraries which are built on top of the interfaces provided by the base libraries. These libraries implement common functionality, and hide additional system dependent information such as file formats and device names.

12.1 Interfaces for libz

[Table 12-1](#) defines the library name and shared object name for the libz library

Table 12-1 libz Definition

Library:	libz
SONAME:	libz.so.1

12.1.1 Compression Library

12.1.1.1 Interfaces for Compression Library

No external functions are defined for libz - Compression Library in this part of the specification. See also the generic specification.

12.2 Data Definitions for libz

This section defines global identifiers and their values that are associated with interfaces contained in libz. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the [ISO C \(1999\)](#) C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

12.2.1 zlib.h

```
/*
 * This header is architecture neutral
 * Please refer to the generic specification for details
 */
```

12.3 Interfaces for libncurses

[Table 12-2](#) defines the library name and shared object name for the libncurses library

Table 12-2 libncurses Definition

Library:	libncurses
SONAME:	libncurses.so.5

12.3.1 Curses

12.3.1.1 Interfaces for Curses

No external functions are defined for libncurses - Curses in this part of the specification. See also the generic specification.

12.4 Data Definitions for libncurses

This section defines global identifiers and their values that are associated with interfaces contained in libncurses. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the [ISO C \(1999\)](#) C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

12.4.1 curses.h

```
/*
 * This header is architecture neutral
 * Please refer to the generic specification for details
 */
```

12.5 Interfaces for libutil

[Table 12-3](#) defines the library name and shared object name for the libutil library

Table 12-3 libutil Definition

Library:	libutil
SONAME:	libutil.so.1

The behavior of the interfaces in this library is specified by the following specifications:

[LSB] [ISO/IEC 23360 Part 1](#)

12.5.1 Utility Functions

12.5.1.1 Interfaces for Utility Functions

An LSB conforming implementation shall provide the architecture specific func-

tions for Utility Functions specified in [Table 12-4](#), with the full mandatory functionality as described in the referenced underlying specification.

Table 12-4 libutil - Utility Functions Function Interfaces

forkpty(GLIBC_2.0) [LSB]	login(GLIBC_2.0) [LSB]	login_tty(GLIBC_2.0) [LSB]	logout(GLIBC_2.0) [LSB]
logwtmp(GLIBC_2.0) [LSB]	openpty(GLIBC_2.0) [LSB]		

V Package Format and Installation

13 Software Installation

13.1 Package Dependencies

The LSB runtime environment shall provide the following dependencies.

lsb-core-ia64

This dependency is used to indicate that the application is dependent on features contained in the LSB-Core specification.

This dependency shall have a version of 3.0.

Other LSB modules may add additional dependencies; such dependencies shall have the format `lsb-module-ia64`.

13.2 Package Architecture Considerations

All packages must specify an architecture of IA64. A LSB runtime environment must accept an architecture of ia64 even if the native architecture is different.

The archnum value in the Lead Section shall be 0x0009.

Annex A Alphabetical Listing of Interfaces

A.1 libc

The behavior of the interfaces in this library is specified by the following Standards.

- [Large File Support](#) [LFS]
- [ISO/IEC 23360 Part 1](#) [LSB]
- [RFC 1831/1832 RPC & XDR](#) [RPC & XDR]
- [SUSv2](#) [SUSv2]
- [ISO POSIX \(2003\)](#) [SUSv3]
- [POSIX 1003.1 2008](#) [SUSv4]
- [SVID Issue 3](#) [SVID.3]
- [SVID Issue 4](#) [SVID.4]

Annex B GNU Free Documentation License (Informative)

This specification is published under the terms of the GNU Free Documentation License, Version 1.1, March 2000

Copyright (C) 2000 Free Software Foundation, Inc. 59 Temple Place, Suite 330, Boston, MA 02111-1307 USA Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

B.1 PREAMBLE

The purpose of this License is to make a manual, textbook, or other written document "free" in the sense of freedom: to assure everyone the effective freedom to copy and redistribute it, with or without modifying it, either commercially or noncommercially. Secondarily, this License preserves for the author and publisher a way to get credit for their work, while not being considered responsible for modifications made by others.

This License is a kind of "copyleft", which means that derivative works of the document must themselves be free in the same sense. It complements the GNU General Public License, which is a copyleft license designed for free software.

We have designed this License in order to use it for manuals for free software, because free software needs free documentation: a free program should come with manuals providing the same freedoms that the software does. But this License is not limited to software manuals; it can be used for any textual work, regardless of subject matter or whether it is published as a printed book. We recommend this License principally for works whose purpose is instruction or reference.

B.2 APPLICABILITY AND DEFINITIONS

This License applies to any manual or other work that contains a notice placed by the copyright holder saying it can be distributed under the terms of this License. The "Document", below, refers to any such manual or work. Any member of the public is a licensee, and is addressed as "you".

A "Modified Version" of the Document means any work containing the Document or a portion of it, either copied verbatim, or with modifications and/or translated into another language.

A "Secondary Section" is a named appendix or a front-matter section of the Document that deals exclusively with the relationship of the publishers or authors of the Document to the Document's overall subject (or to related matters) and contains nothing that could fall directly within that overall subject. (For example, if the Document is in part a textbook of mathematics, a Secondary Section may not explain any mathematics.) The relationship could be a matter of historical connection with the subject or with related matters, or of legal, commercial, philosophical, ethical or political position regarding them.

The "Invariant Sections" are certain Secondary Sections whose titles are designated, as being those of Invariant Sections, in the notice that says that the Document is released under this License.

The "Cover Texts" are certain short passages of text that are listed, as Front-Cover Texts or Back-Cover Texts, in the notice that says that the Document is released under this License.

A "Transparent" copy of the Document means a machine-readable copy, represented in a format whose specification is available to the general public, whose contents can be viewed and edited directly and straightforwardly with generic text editors or (for images composed of pixels) generic paint programs or (for drawings) some widely available drawing editor, and that is suitable for input to text formatters or for automatic translation to a variety of formats suitable for input to text formatters. A copy made in an otherwise Transparent file format whose markup has been designed to thwart or discourage subsequent modification by readers is not Transparent. A copy that is not "Transparent" is called "Opaque".

Examples of suitable formats for Transparent copies include plain ASCII without markup, Texinfo input format, LaTeX input format, SGML or XML using a publicly available DTD, and standard-conforming simple HTML designed for human modification. Opaque formats include PostScript, PDF, proprietary formats that can be read and edited only by proprietary word processors, SGML or XML for which the DTD and/or processing tools are not generally available, and the machine-generated HTML produced by some word processors for output purposes only.

The "Title Page" means, for a printed book, the title page itself, plus such following pages as are needed to hold, legibly, the material this License requires to appear in the title page. For works in formats which do not have any title page as such, "Title Page" means the text near the most prominent appearance of the work's title, preceding the beginning of the body of the text.

B.3 VERBATIM COPYING

You may copy and distribute the Document in any medium, either commercially or noncommercially, provided that this License, the copyright notices, and the license notice saying this License applies to the Document are reproduced in all copies, and that you add no other conditions whatsoever to those of this License. You may not use technical measures to obstruct or control the reading or further copying of the copies you make or distribute. However, you may accept compensation in exchange for copies. If you distribute a large enough number of copies you must also follow the conditions in section 3.

You may also lend copies, under the same conditions stated above, and you may publicly display copies.

B.4 COPYING IN QUANTITY

If you publish printed copies of the Document numbering more than 100, and the Document's license notice requires Cover Texts, you must enclose the copies in covers that carry, clearly and legibly, all these Cover Texts: Front-Cover Texts on the front cover, and Back-Cover Texts on the back cover. Both covers must also clearly and legibly identify you as the publisher of these copies. The front cover must present the full title with all words of the title equally prominent and visible. You may add other material on the covers in addition. Copying with changes limited to the covers, as long as they preserve the title of the Document and satisfy these conditions, can be treated as verbatim copying in other respects.

If the required texts for either cover are too voluminous to fit legibly, you should put the first ones listed (as many as fit reasonably) on the actual cover, and continue the rest onto adjacent pages.

If you publish or distribute Opaque copies of the Document numbering more than 100, you must either include a machine-readable Transparent copy along with each Opaque copy, or state in or with each Opaque copy a publicly-accessible computer-network location containing a complete Transparent copy of the Document, free of added material, which the general network-using public has access to download anonymously at no charge using public-standard network protocols. If you use the latter option, you must take reasonably prudent steps, when you begin distribution of Opaque copies in quantity, to ensure that this Transparent copy will remain thus accessible at the stated location until at least one year after the last time you distribute an Opaque copy (directly or through your agents or retailers) of that edition to the public.

It is requested, but not required, that you contact the authors of the Document well before redistributing any large number of copies, to give them a chance to provide you with an updated version of the Document.

B.5 MODIFICATIONS

You may copy and distribute a Modified Version of the Document under the conditions of sections 2 and 3 above, provided that you release the Modified Version under precisely this License, with the Modified Version filling the role of the Document, thus licensing distribution and modification of the Modified Version to whoever possesses a copy of it. In addition, you must do these things in the Modified Version:

- A. Use in the Title Page (and on the covers, if any) a title distinct from that of the Document, and from those of previous versions (which should, if there were any, be listed in the History section of the Document). You may use the same title as a previous version if the original publisher of that version gives permission.
- B. List on the Title Page, as authors, one or more persons or entities responsible for authorship of the modifications in the Modified Version, together with at least five of the principal authors of the Document (all of its principal authors, if it has less than five).
- C. State on the Title page the name of the publisher of the Modified Version, as the publisher.
- D. Preserve all the copyright notices of the Document.
- E. Add an appropriate copyright notice for your modifications adjacent to the other copyright notices.
- F. Include, immediately after the copyright notices, a license notice giving the public permission to use the Modified Version under the terms of this License, in the form shown in the Addendum below.
- G. Preserve in that license notice the full lists of Invariant Sections and required Cover Texts given in the Document's license notice.
- H. Include an unaltered copy of this License.
- I. Preserve the section entitled "History", and its title, and add to it an item stating at least the title, year, new authors, and publisher of the Modified Version as given on the Title Page. If there is no section entitled "History" in the Document, create one stating the title, year, authors, and publisher of the Document as given on its Title Page, then add an item describing the Modified Version as stated in the previous sentence.

J. Preserve the network location, if any, given in the Document for public access to a Transparent copy of the Document, and likewise the network locations given in the Document for previous versions it was based on. These may be placed in the "History" section. You may omit a network location for a work that was published at least four years before the Document itself, or if the original publisher of the version it refers to gives permission.

K. In any section entitled "Acknowledgements" or "Dedications", preserve the section's title, and preserve in the section all the substance and tone of each of the contributor acknowledgements and/or dedications given therein.

L. Preserve all the Invariant Sections of the Document, unaltered in their text and in their titles. Section numbers or the equivalent are not considered part of the section titles.

M. Delete any section entitled "Endorsements". Such a section may not be included in the Modified Version.

N. Do not retitle any existing section as "Endorsements" or to conflict in title with any Invariant Section.

If the Modified Version includes new front-matter sections or appendices that qualify as Secondary Sections and contain no material copied from the Document, you may at your option designate some or all of these sections as invariant. To do this, add their titles to the list of Invariant Sections in the Modified Version's license notice. These titles must be distinct from any other section titles.

You may add a section entitled "Endorsements", provided it contains nothing but endorsements of your Modified Version by various parties--for example, statements of peer review or that the text has been approved by an organization as the authoritative definition of a standard.

You may add a passage of up to five words as a Front-Cover Text, and a passage of up to 25 words as a Back-Cover Text, to the end of the list of Cover Texts in the Modified Version. Only one passage of Front-Cover Text and one of Back-Cover Text may be added by (or through arrangements made by) any one entity. If the Document already includes a cover text for the same cover, previously added by you or by arrangement made by the same entity you are acting on behalf of, you may not add another; but you may replace the old one, on explicit permission from the previous publisher that added the old one.

The author(s) and publisher(s) of the Document do not by this License give permission to use their names for publicity for or to assert or imply endorsement of any Modified Version.

B.6 COMBINING DOCUMENTS

You may combine the Document with other documents released under this License, under the terms defined in section 4 above for modified versions, provided that you include in the combination all of the Invariant Sections of all of the original documents, unmodified, and list them all as Invariant Sections of your combined work in its license notice.

The combined work need only contain one copy of this License, and multiple identical Invariant Sections may be replaced with a single copy. If there are multiple Invariant Sections with the same name but different contents, make the ti-

tle of each such section unique by adding at the end of it, in parentheses, the name of the original author or publisher of that section if known, or else a unique number. Make the same adjustment to the section titles in the list of Invariant Sections in the license notice of the combined work.

In the combination, you must combine any sections entitled "History" in the various original documents, forming one section entitled "History"; likewise combine any sections entitled "Acknowledgements", and any sections entitled "Dedications". You must delete all sections entitled "Endorsements."

B.7 COLLECTIONS OF DOCUMENTS

You may make a collection consisting of the Document and other documents released under this License, and replace the individual copies of this License in the various documents with a single copy that is included in the collection, provided that you follow the rules of this License for verbatim copying of each of the documents in all other respects.

You may extract a single document from such a collection, and distribute it individually under this License, provided you insert a copy of this License into the extracted document, and follow this License in all other respects regarding verbatim copying of that document.

B.8 AGGREGATION WITH INDEPENDENT WORKS

A compilation of the Document or its derivatives with other separate and independent documents or works, in or on a volume of a storage or distribution medium, does not as a whole count as a Modified Version of the Document, provided no compilation copyright is claimed for the compilation. Such a compilation is called an "aggregate", and this License does not apply to the other self-contained works thus compiled with the Document, on account of their being thus compiled, if they are not themselves derivative works of the Document.

If the Cover Text requirement of section 3 is applicable to these copies of the Document, then if the Document is less than one quarter of the entire aggregate, the Document's Cover Texts may be placed on covers that surround only the Document within the aggregate. Otherwise they must appear on covers around the whole aggregate.

B.9 TRANSLATION

Translation is considered a kind of modification, so you may distribute translations of the Document under the terms of section 4. Replacing Invariant Sections with translations requires special permission from their copyright holders, but you may include translations of some or all Invariant Sections in addition to the original versions of these Invariant Sections. You may include a translation of this License provided that you also include the original English version of this License. In case of a disagreement between the translation and the original English version of this License, the original English version will prevail.

B.10 TERMINATION

You may not copy, modify, sublicense, or distribute the Document except as expressly provided for under this License. Any other attempt to copy, modify, sublicense or distribute the Document is void, and will automatically terminate your rights under this License. However, parties who have received copies, or

rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

B.11 FUTURE REVISIONS OF THIS LICENSE

The Free Software Foundation may publish new, revised versions of the GNU Free Documentation License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns. See <http://www.gnu.org/copyleft/>.

Each version of the License is given a distinguishing version number. If the Document specifies that a particular numbered version of this License "or any later version" applies to it, you have the option of following the terms and conditions either of that specified version or of any later version that has been published (not as a draft) by the Free Software Foundation. If the Document does not specify a version number of this License, you may choose any version ever published (not as a draft) by the Free Software Foundation.

B.12 How to use this License for your documents

To use this License in a document you have written, include a copy of the License in the document and put the following copyright and license notices just after the title page:

Copyright (c) YEAR YOUR NAME. Permission is granted to copy, distribute and/or modify this document under the terms of the GNU Free Documentation License, Version 1.1 or any later version published by the Free Software Foundation; with the Invariant Sections being LIST THEIR TITLES, with the Front-Cover Texts being LIST, and with the Back-Cover Texts being LIST. A copy of the license is included in the section entitled "GNU Free Documentation License".

If you have no Invariant Sections, write "with no Invariant Sections" instead of saying which ones are invariant. If you have no Front-Cover Texts, write "no Front-Cover Texts" instead of "Front-Cover Texts being LIST"; likewise for Back-Cover Texts.

If your document contains nontrivial examples of program code, we recommend releasing these examples in parallel under your choice of free software license, such as the GNU General Public License, to permit their use in free software.
